

# Advanced Nitrogen Removal Configuration with MBR Application for Water Reuse

Peter L. Dold, Weiwei Du

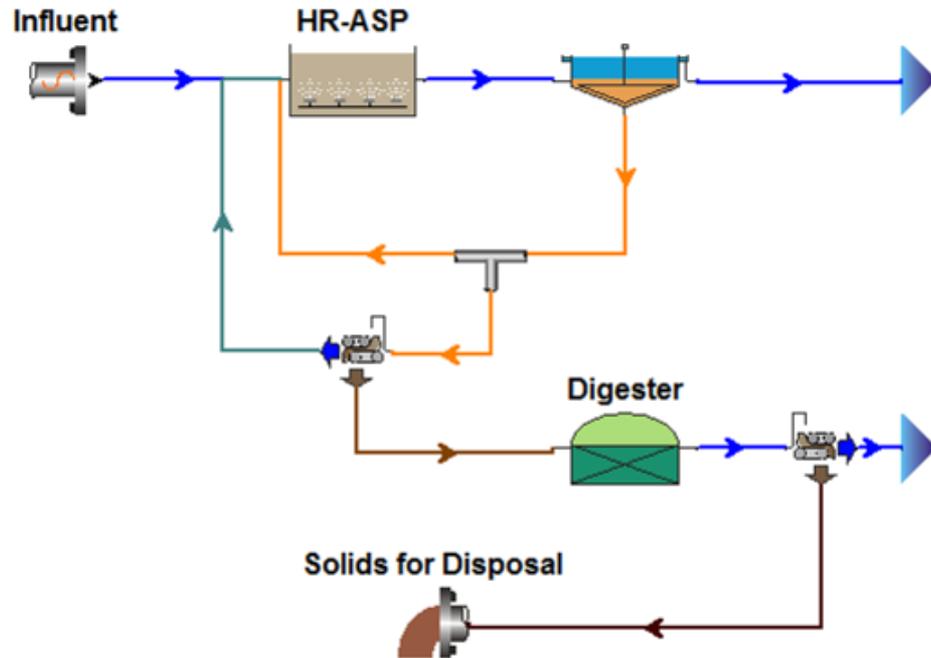

EnviroSim Associates Ltd.

## Outline

- **Seeking a sustainable N removal / water-reuse system**
  - COD removal – energy recovery
  - Efficient N removal (without C addition or depending on influent C)
- **Advanced nitrogen removal**
  - Nitrite shunt & Deammonification
  - NOB washout
- **High rate ASP → Deammonification – MBR system**
  - Sidestream + mainstream nitrification-deammonification
  - Sidestream nitrification + mainstream deammonification

## Emphasis on sustainability, energy neutrality

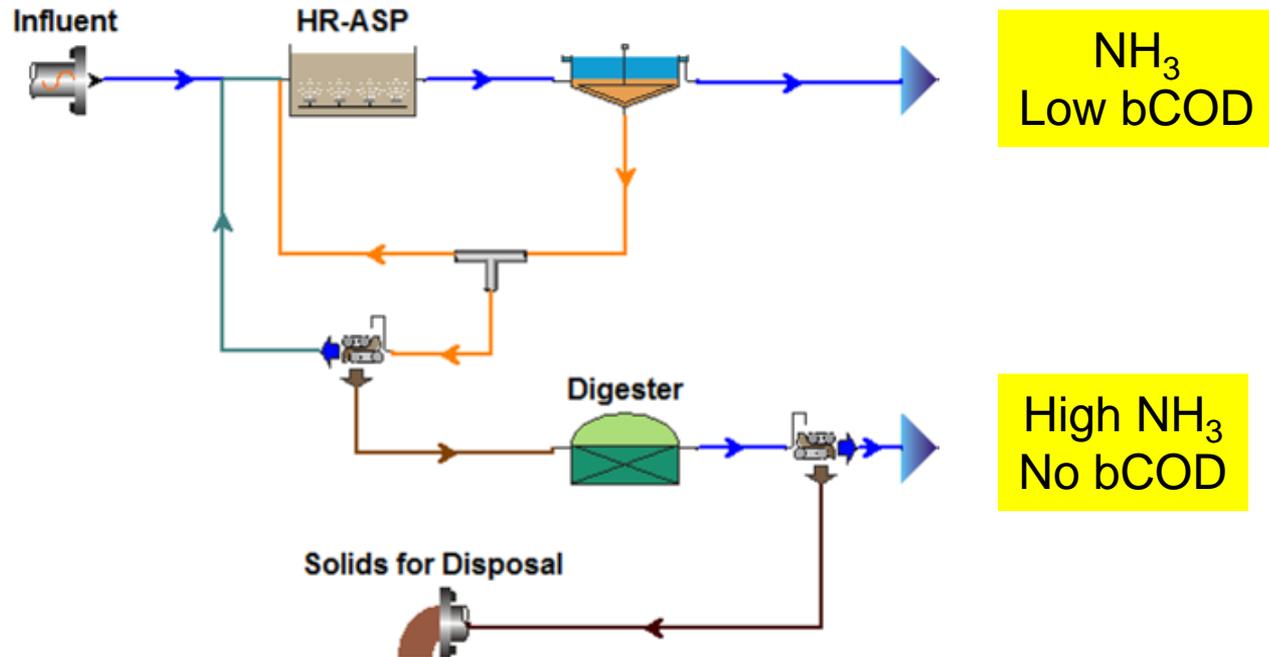

## COD removal

- **HR-ASP system**
  - Impact of SRT

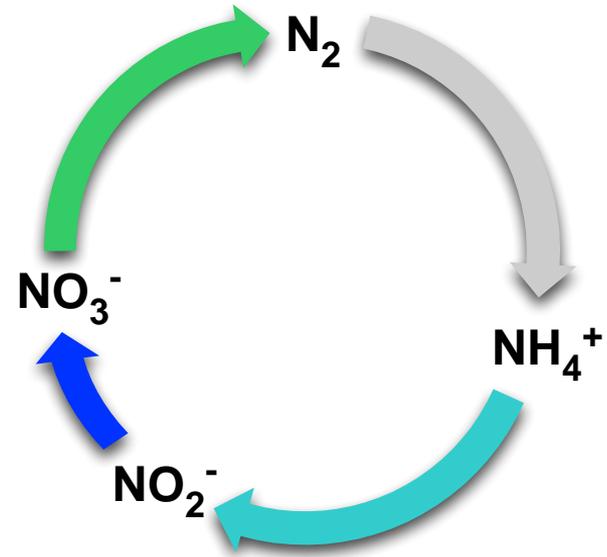

| SRT (Day) | COD oxidized in HR-ASP (kg/d) | COD in overflow (kg/d) | COD sent to digester (kg/d) | Methane production (m <sup>3</sup> /kg influent COD) | % (COD CH <sub>4</sub> / influent COD) |
|-----------|-------------------------------|------------------------|-----------------------------|--|--|
| 0.50      | 1,215                         | 2,087                  | 8,699                       | 0.192  | 49.4%                                  |
| 0.75      | 2,050                         | 1,439                  | 8,512                       | 0.176  | 45.3%                                  |
| 1.00      | 3,030                         | 1,186                  | 7,783                       | 0.143  | 36.9%                                  |

| SRT (Day) | HR-ASP overflow (% of TN) | Stream to digester (% of TN) |
|-----------|---------------------------|------------------------------|
| 0.50      | 67%                       | 32%                          |
| 0.75      | 62%                       | 38%                          |
| 1.00      | 57%                       | 41%                          |

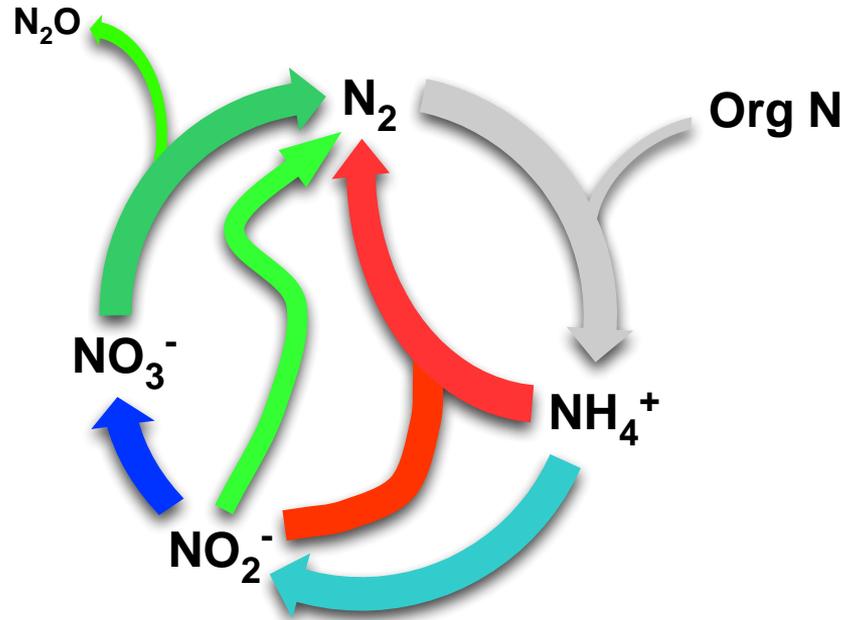

## Emphasis on sustainability, energy neutrality

# N Removal

# N Removal

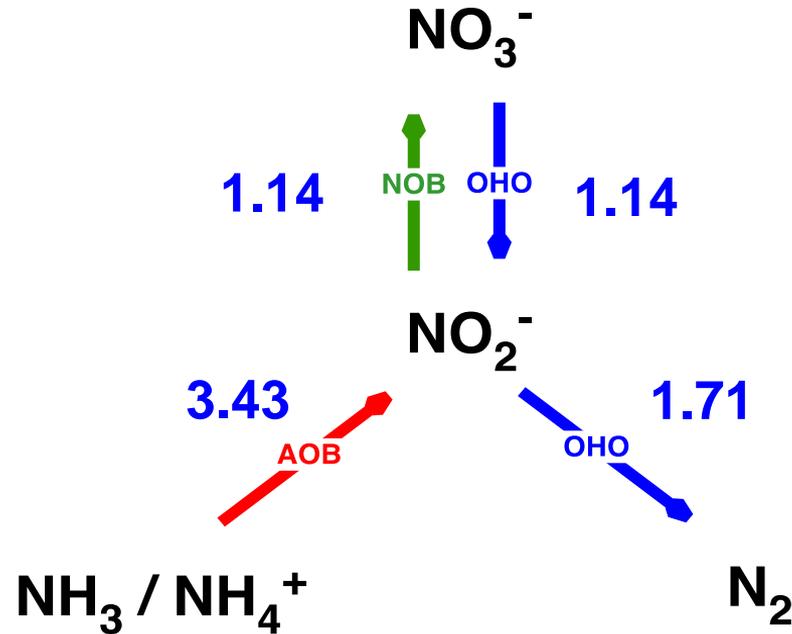

# Nitrogen Removal

- **Shortcut N removal (Nitrite shunt)**
  - Reduce oxygen demand
  - Reduce C requirements
- **Deammonification**
  - Small oxygen demand
  - No C requirement

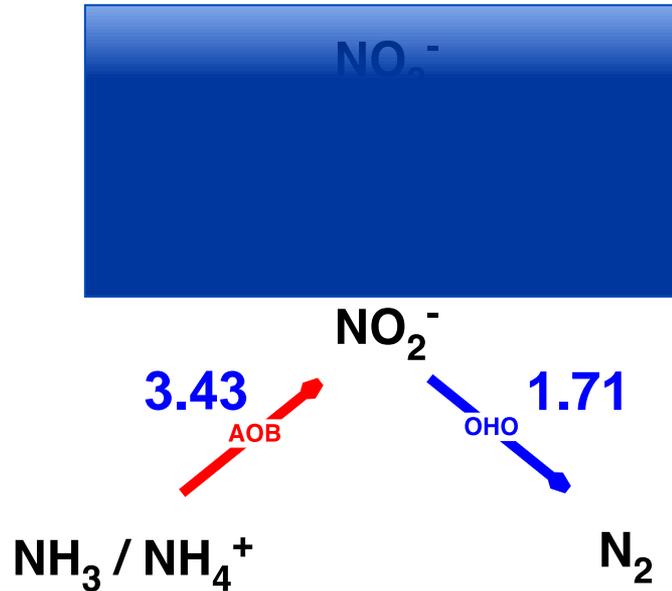

# Nitrification and Denitrification

- Oxygen requirements

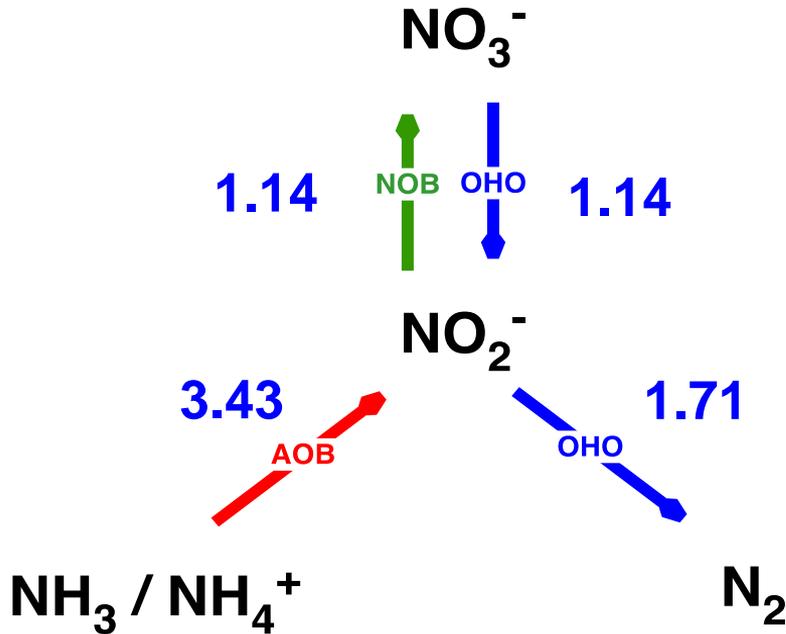

# Nitrification and Denitrification

- Nitrite Shunt

# Nitrification and Denitrification

- Nitrite shunt – no benefit if influent C available

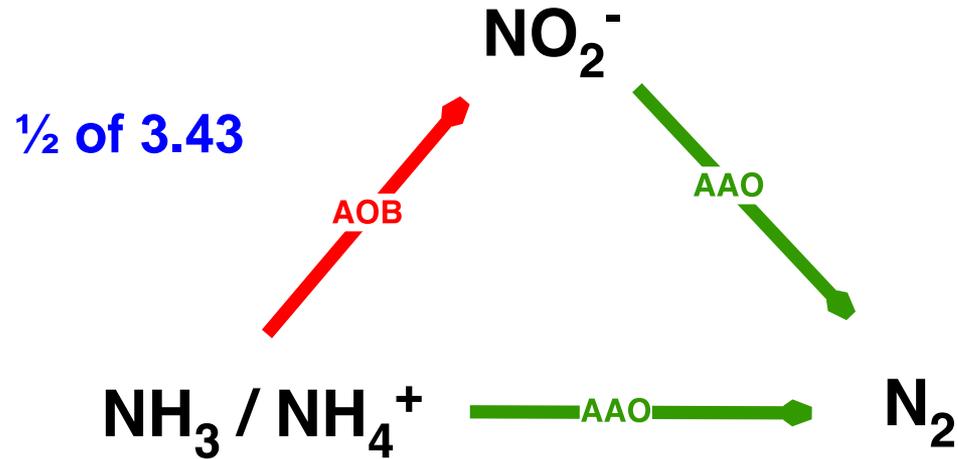

## Full nite-denite:

|                 |      |
|-----------------|------|
| Spend           | 4.57 |
| Credit          | 2.86 |
| <u>Net cost</u> | 1.71 |

## Nitrite shunt:

|                 |      |
|-----------------|------|
| Spend           | 3.43 |
| Credit          | 1.71 |
| <u>Net cost</u> | 1.71 |

# Deammonification

# NOB Washout

- Presented as a kinetic control issue

$$\frac{1}{f_A \cdot m_{AOB} - b_{AOB}} < \text{SRT} < \frac{1}{f_A \cdot m_{NOB} - b_{NOB}}$$

# NOB Washout

- Presented as a kinetic control issue

$$\frac{1}{f_A \cdot m_{AOB} - b_{AOB}} < \text{SRT} < \frac{1}{f_A \cdot m_{NOB} - b_{NOB}}$$

$$\mu_{AOB} = f(\text{NH}_3, \text{DO}, T, \dots)$$

$$\mu_{AOB} = f(\text{NO}_2, \text{DO}, T, \dots)$$

+ FA inhibition

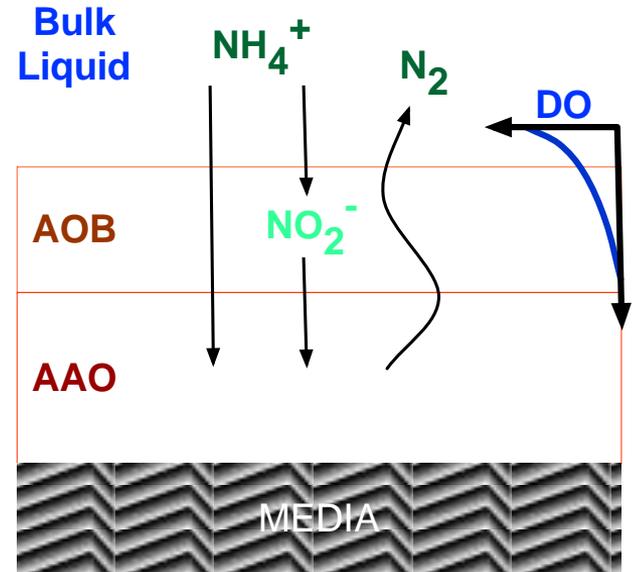

+ FNA inhibition

## NOB Washout

- **Sidestream treatment (e.g. centrate)**
  - High  $\text{NH}_3$ , high T
  - Control DO and SRT/HRT
    - NOB washout
  - Integrate deammonification
    - On/off aeration
- **Mainstream treatment**
  - Some factors not available
    - FA, FNA inhibition, lower T

## NOB Washout

- **Attached growth biofilm**
  - Nitritation
  - Deammonification
- **Findings / possible benefits**
  - Easy to implement sidestream AAO
  - Seed mainstream from sidestream
  - Online control simple
  - IFAS-type configurations favoured
  - Biomass retention crucial
    - MBR

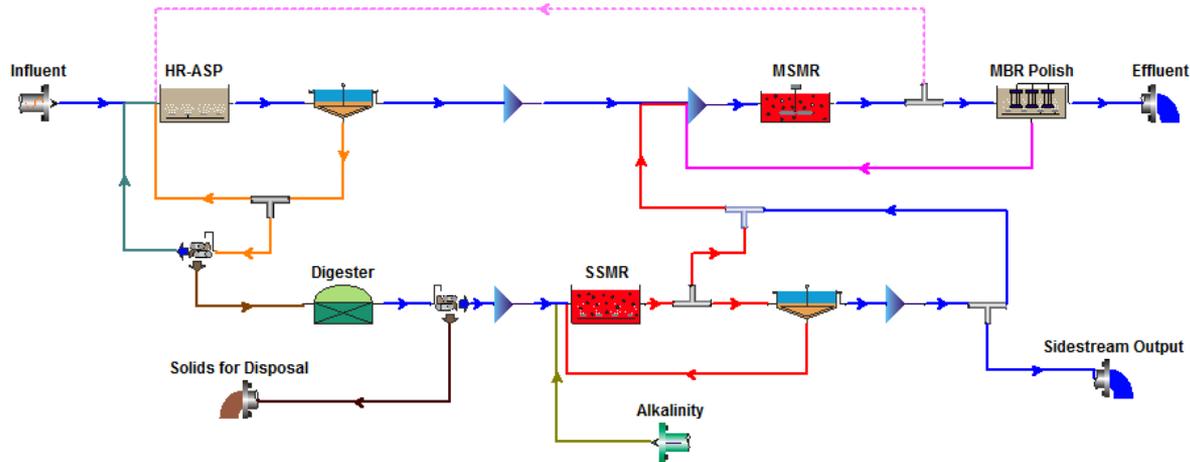

# Basis of Efficient C and N Removal Schemes

- **High Rate Activated Sludge**
  - COD removal – energy recovery
- **Sidestream Media Bioreactors**
  - Handling dewatered digestate
- **Mainstream Media Bioreactors – Deammonification**
  - Seeding of AOB and/or AAO from sidestream
- **Membrane Bioreactor**
  - Polishing
  - Biomass retention - Effluent suitable for reuse

## Deammonification – MBR configuration

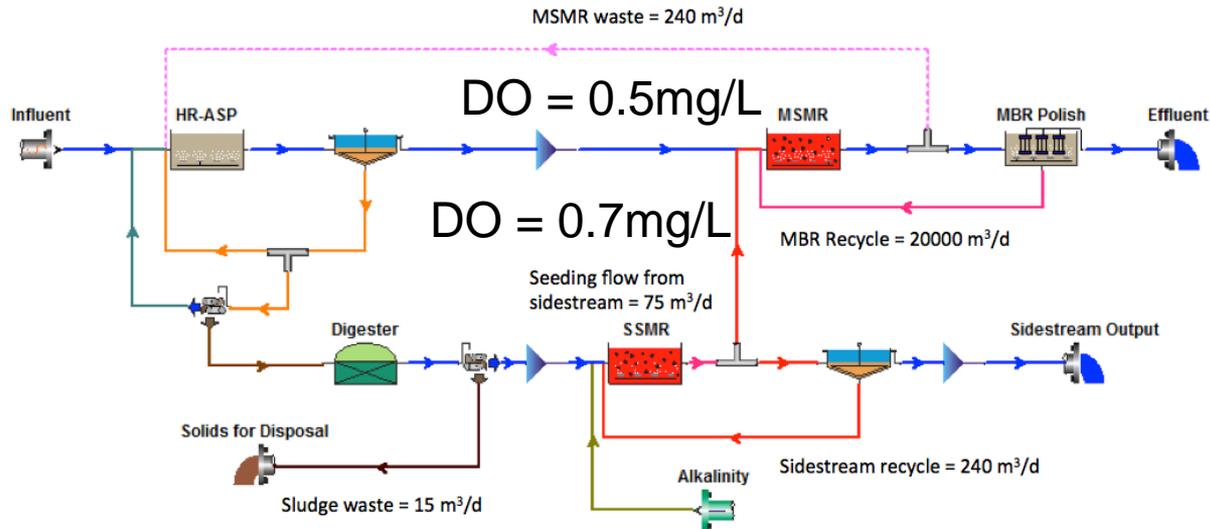

- **HR-ASP, Media Reactors, and MBR**
  - Compact, simple control strategy, energy efficient, and low N and solids-free effluent for water reuse.

Influent flow rate  
24,000m<sup>3</sup>/d,  
COD 500mg/L,  
TKN 40mgN/L.

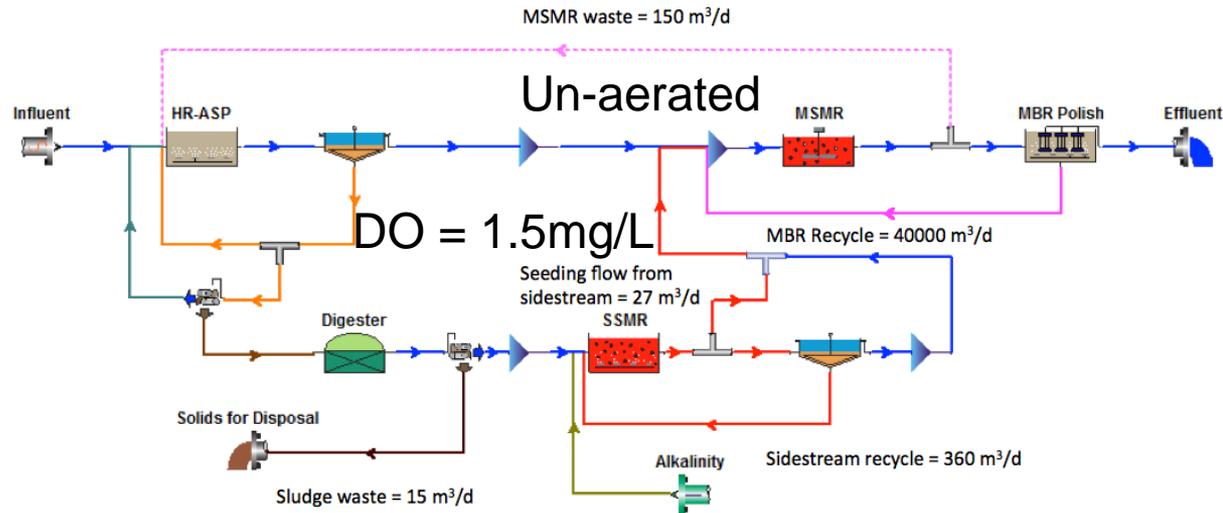

## Nitrogen Removal (1)

- **Deammonification in mainstream and sidestream**
  - MSMR and SSMR are two single-stage deammonification reactors
  - AAO seeding from SSMR to MSMR

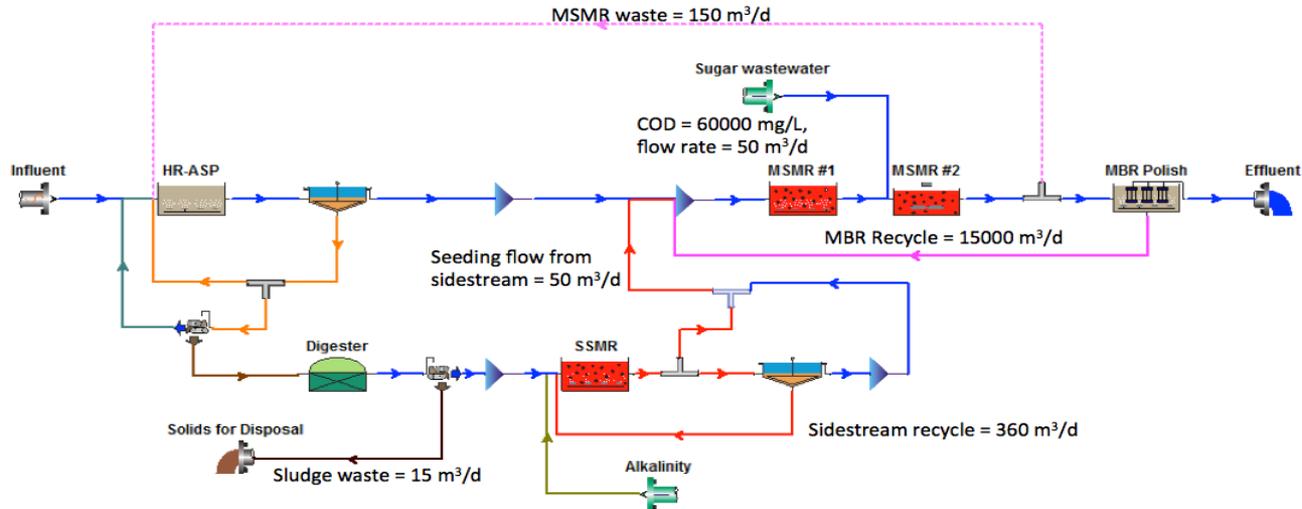

## Nitrogen Removal (2a)

- **Sidestream nitrification and mainstream deammonification**
  - NOB washout in SSMR (DO = 1.5, SRT = 8 days)
  - Un-aerated MSMR favours the growth of AAOs

## Nitrogen Removal (2b)

- **SSMR nitritation; MSMR deammonification & denitrification**
  - NOB washout in SSMR (DO = 2.5, SRT = 6.5 days)
  - Deammonification and nitrification in MSMR #1 (DO = 1)
  - Denitrification in MSMR #2 (un-aerated)

# Conclusions

- **Energy-efficient advanced N and solids removal system**
  - HR-ASP to capture a large portion of influent COD
  - Maximized biogas generation in anaerobic digestion
  - Deammonification for N removal
  - MBR ensures a solids-free effluent – water reuse
- **Deammonification – MBR configuration**
  - TN in the effluent ~ 10 mgN/L (mainly NO<sub>2</sub>)
- **Modified deammonification – MBR configuration**
  - TN in the effluent < 5 mgN/L (mainly NO<sub>3</sub>)

# Getting rid of NOBs

- Mainstream treatment
  - Kinetic and stoichiometric control
